

InFRMed Flood Decisions

Federal Partnerships at Work

Kristine Blickenstaff, PE
NCTCOG
April 10, 2018

Overview

- **InFRM**
 - What is InFRM?
 - InFRM Projects
 - InFRM Website
- **estBFE Viewer**
 - Base Level Engineering
 - Demo
- **InFRM FIM**
 - Purpose
 - Products
 - Distribution of products

InFRM

- FEMA Region 6 - Sponsor
- U.S. Army Corps of Engineers (USACE)
- U.S. Geological Survey (USGS)
- National Weather Service – WGRFC

IWRSS - InFRM

- **Participating agencies**
 - Same for both initiatives
- **Goals**
 - Integrate information and simplify access to data
 - Increase accuracy and timeliness of information
 - Provide high resolution information and forecasts
 - Enrich stakeholder participation
- **So... what's the difference?**
 - InFRM is developing products
 - InFRM will be working under IWRSS standards

A Web Presence for InFRM

Interagency Flood Risk Management

Collaborating Nationally. Empowering Locally.

Flooding remains the leading cause of natural-disaster loss across the United States. The Integrated Flood Risk Management (InFRM) team brings together Federal Partners with mission areas of hazard mitigation, emergency management, floodplain management, natural resources management or conservation to leverage the skillsets, resources and programs to determine the needs of communities and define solutions and implement measures to reduce long term flood risk throughout the States of Arkansas, Louisiana, New Mexico, Oklahoma and Texas.

In 2014, the Federal Emergency Management Agency (FEMA) began sponsorship of the InFRM team initiative to allow Federal teams across the States of Texas, Oklahoma, New Mexico, Louisiana and Arkansas to better align and integrate. Currently, the InFRM team is comprised of FEMA, US Army Corps of Engineers, US Geological Survey, and the National Weather Service. No single agency has all the answers, but through a coordinated effort of multiple programs and various perspectives, a cohesive solution can be found. By applying their shared knowledge, the InFRM team can also enhance response and recovery efforts when flood events do occur.

While floods are impossible to prevent completely, and there is no way to guarantee protection of property, loss of life can be greatly reduced when communities have access to good data, practice sound land use, floodplain management and development practices and incorporate warning systems. Local communities can partner with the InFRM team to investigate solutions to reduce their communities flood risk.

Partner Agencies

This effort will be accomplished by an interagency coalition comprised of the Federal Emergency Management Agency, U.S. Army Corps of Engineers, U.S. Geological Survey, and the National Weather Service. These agencies are currently in partnership through the group known as the Interagency Flood Risk Management (InFRM) team and this effort will be undertaken by this group. The InFRM team will reach out to state and local government organizations as well as private industry to aid in moving this monumental effort forward.

InFRM Projects – estBFE Viewer

Estimate Your Base Flood Elevation

Base Level Engineering is a watershed-wide engineering modeling method that leverages high resolution ground elevation, automated model building techniques, and manual model review to prepare broad and accurate flood risk information for FEMA to assess its current flood hazard inventory. Base Level Engineering prepares flood risk information with scalable engineering, allowing FEMA to both assess its current flood hazard inventory and expand the coverage and availability of flood risk information to communities and individuals interested in reviewing their potential flood risk.

Goal: Centralized and available flood hazard analysis to support floodplain management activities and development review, while increasing risk awareness for individuals.

Benefits:

- The Estimated Base Flood Elevation Viewer allows users to determine the flood risk (High, Moderate, Low) throughout watersheds that have been assessed using Base Level Engineering methods.
- Estimated base flood elevations and flood depths for site specific locations (within the estimated 1% annual chance floodplain)
- Immediate point-click-download access to engineering models and Base Level Engineering datasets.
- Allows Federal, State, and local governments, as well as individuals, access to flood risk information.

FEMA is working with its Federal and State partners to identify watershed basins in need of flood risk information. Additional watersheds will be invested in each fiscal year, if your community is interested in having watersheds in your vicinity assessed, contact us to let us know of your interest.

InFRM Projects – Hydrologic Basin Studies

[Background & Partners](#)

[Estimate Your Base Flood Elevation](#)

[Flood Inundation Mapping](#)

[Hydrologic Basin Studies](#)

Hydrologic Basin Studies

Goal: Develop accurate estimations of the 2, 5, 10, 25, 50, 100, 250, and 500 year flows

Benefits: Results from the three methods will be compared and recommended flows will be presented using a united front of the four federal agencies.

Current Basins: Richland Chambers, San Marcos, Guadalupe, Trinity, and Neches

Methods:

- Statistical analysis of flood flow frequencies using systematic record,
- rainfall runoff modeling (HEC-HMS), and
- statistical analysis of synthetic period of record generated using an operations model (RiverWare) to extend historic period of record and account for regulation in the basin.

[Find Out More »](#)

Flood Inundation Mapping

Goal: Develop best available flood inundation map libraries for Texas and make them easily accessible to emergency managers and the public.

Benefits: Easily communicate to stakeholders what current and forecasted flood conditions are.

Methods:

- Inventory and evaluate engineering scale hydraulic models (HEC-RAS).
- If model does not meet Integrated Water Resources Science and Services (IWRSS) standards update and recalibrate, if it does use existing model to generate flood inundation library.
- If a high priority site does not have an engineering scale model, work with local agencies to develop model to generate and library.
- Develop web application to get the libraries out to public including current conditions, forecast conditions, and scenario analysis.

Base Level Engineering

an Evolution in Flood Risk Mapping

FEMA

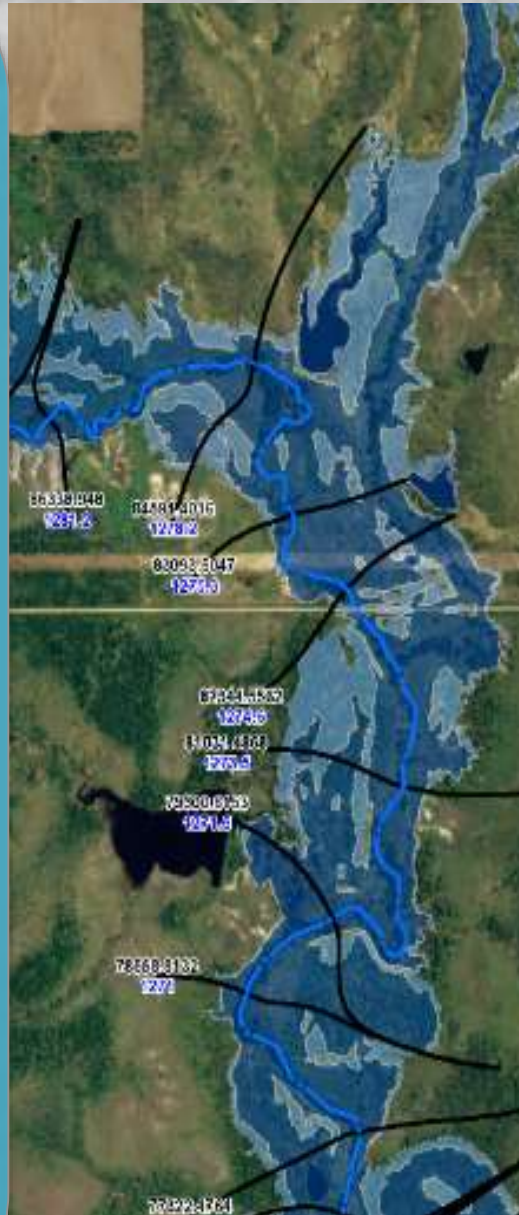

What is Base Level Engineering?

1

Base Level Engineering provides cursory flood risk modeling and mapping produced using high resolution elevation data and the latest modeling technologies. As its name suggests, Base Level Engineering modeling meets FEMA's minimum engineering and mapping requirements, producing a flood study equivalent to a Zone A floodplain.

Once a Base Level Engineering assessment is prepared, FEMA and its State and Local Mapping Partners compare the results against the current flood risk information shown on the Nation's Flood Insurance Rate Maps (FIRMs). FEMA is required to review the validity of its flood risk information once each five years.

Base Level Engineering -
Floodplains

Base Level Engineering -
Flood Depth Grids

Base Level Engineering & Flood Risk Datasets

2

Each BLE study includes many more datasets than a typical Zone A study may have included in the past. The BLE study includes an assessment of the 10%, 4%, 2%, 1%, 1%+, 1%-, and 0.2% hazards (H&H only). Data available from a standard BLE study include:

- Fully-processed LIDAR
- Hydrologic assessment of the watershed, typically using regional regression equations
- Hydraulic modeling (no channel or hydraulic structure survey is included)
- Floodplain mapping (10%, 1%, and 0.2% only)
- Water Surface Elevation Grids (1% and 0.2% only)
- Depth Grids (1% and 0.2% only)

Base Level Engineering & Local Development

3

Base Level Engineering supports local community development review by...

estBFE Website

- **Scope: Data access, download and visualization for FEMA BLE models and data**
- **Accomplishments**
 - Collect, inventory, organize FEMA data
 - Build data management structure
 - Produce map services
 - Development of the model inventory and download application
 - Data visualization viewer

My Flood Report

Estimated Base Flood Elevation (estBFE)

Flood Risk Information Report

FEMA is providing a look at flood data availability and relative Base Level Engineering analysis through the Estimated Base Flood Elevation Viewer (Estimated BFE Viewer). Base Level Engineering uses high resolution ground elevation data, flood flow calculations, and fundamental engineering modeling techniques to define flood extents for streams. The viewer is an effective tool for property owners, community officials, and land developers to identify flood risk, estimated flood elevations, and flood depths for watersheds where Base Level Engineering has been prepared.

Flood Event	Estimated Flood Depth*	Estimated Base Flood Elevation*
1 Percent (100 Year)	No Data	No Data
0.2 Percent (500 Year)	1.520344 feet above land surface	577.400024 feet above sea level

* The information included in this report is based on the location marker shown in the map. Results are not considered an official determination.

There is an effective study or more detailed report for this area. Please review the Flood Insurance Rate Map (FIRM) on the FEMA Flood Map Service Center website (<https://msc.fema.gov>). On effective FIRM panels, Special Flood Hazard Areas (SFHAs), or areas impacted by the 1-percent-annual-chance flood event, are indicated by a Zone A (Riverine) or V (Coastal). Zones AE and VE depict high hazard areas that have been studied in detail and provide Base Flood Elevations rounded to the nearest whole foot.

Knowing Your Risk

Base Level Engineering data availability and analysis information is important because it can be used to:

- Inform floodplain management decisions and ordinance administration;
- Identify significant floodplain changes;
- Serve as base modeling for map revisions; and
- Support the Zone A BFE information for a Letter of Map Amendment (LOMA) request.

InFRM Flood Inundation Mapping

Background – Flooding in the US

- Floods are the leading cause of natural disaster losses in the US
- 30yr average = \$7.96 billion in damages/yr, 82 fatalities/yr
- 2016 - TX 30% of fatalities (38/126)

Year	Flood Damages (Water Year) <small>Adjusted to 2014 Inflation Water year (e.g. WY 2014 is Oct 1, 2013 through Sep 30, 2014)</small>	Flood Fatalities <small>Calendar Year (Jan 1-Dec 31)</small>
2014	\$2,861,426,089	38
2013	\$2,210,809,876	80
2012	\$522,119,985	29
2011	\$9,102,294,087	113
2010	\$5,615,860,859	103

Background – Flooding in Texas

- Texas annual precipitation 10” – 60”
- Extreme variability in annual totals
 - DFW 2015 – 60”
 - DFW 2014 – 25”

Trinity River at Dallas 5/26/2015

Trinity River below Dallas 5/26/2015

Background – Flooding in Texas

- Intense storm events
 - 10” – 20” in less than a day
 - Trigger significant flooding
 - Threat to life, property, and infrastructure

Wimberley 2015

A better warning system is needed!

- Inundation requests during 2015/2016 floods
- USACE/USGS/Others?
- Over 1,500 river miles
- Requests came from
 - Federal Agencies
 - State Agencies
 - Cities
 - Municipalities
- Disadvantages
 - Lack of quality models
 - Prioritizing
 - Pressure for time
 - Potential for error

InFRM Flood Inundation Mapping Program Goals

- **Develop inundation mapping libraries using best available science**
 - Readily available to emergency managers via web
 - Begin at minor flood state, end at max expected flood
 - Produced at appropriate intervals for the reach (1' max)
 - Correlated to nearest NWS-RFC forecast point
 - Maps automatically update when new forecast is released

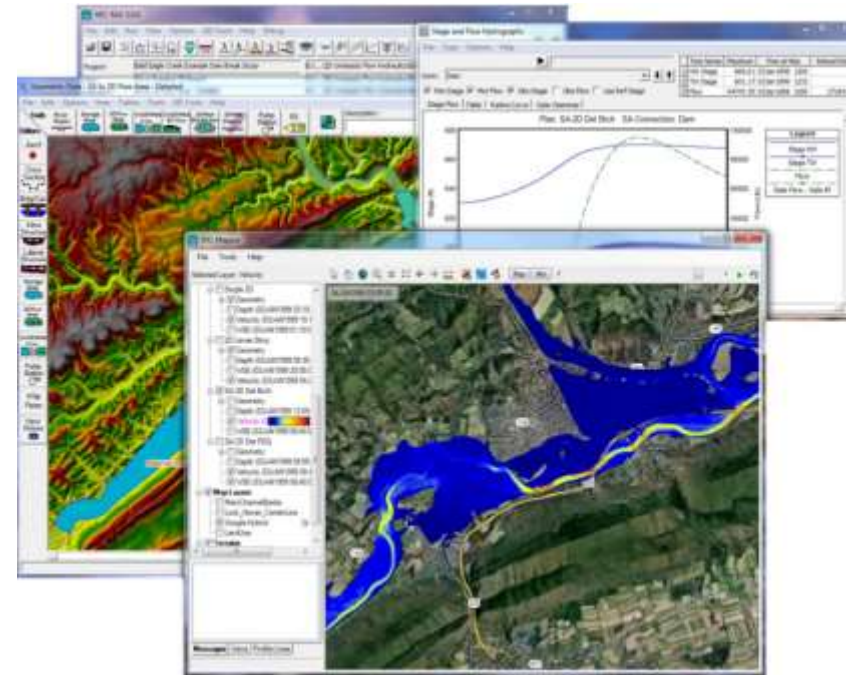

Techniques and Methods

■ Types of Models

- HEC-RAS, MIKE
- Base Level Engineering
- FESM, R&R
- Others?

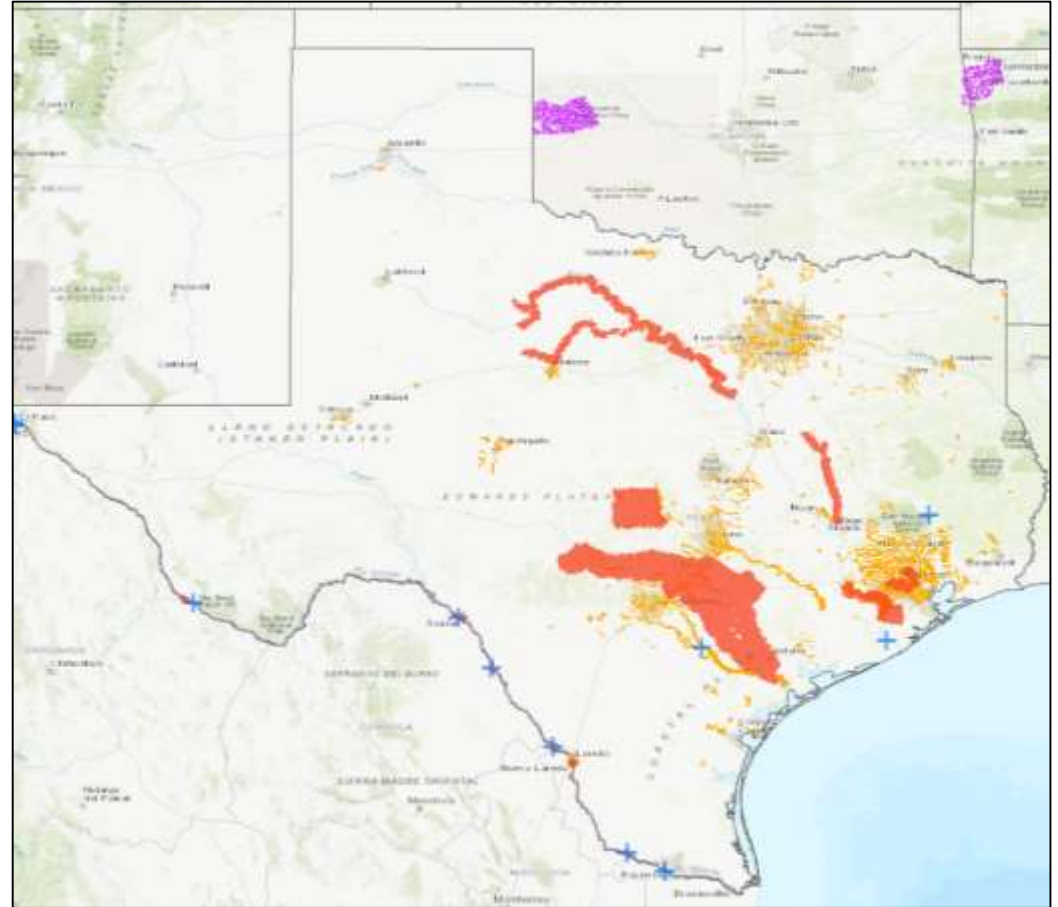

■ Existing model inventory

- FEMA effective models
- State funded models
- Local governments
- River authorities
- USGS Scientific Investigations
- USACE Corps Water Managements Systems (CWMS)
- Consulting firms
- Others?

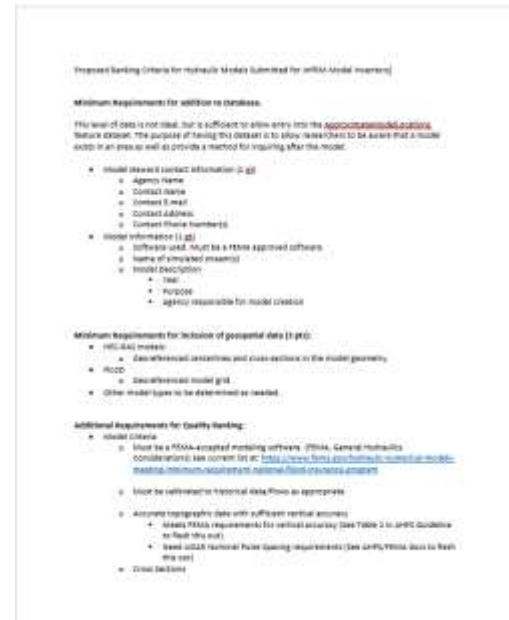

Hydraulic Model Inventory Database

- 3,780 models described in inventory
- 3,773 centerlines imported
- 105,960 cross-sections imported
- Database is still undergoing development

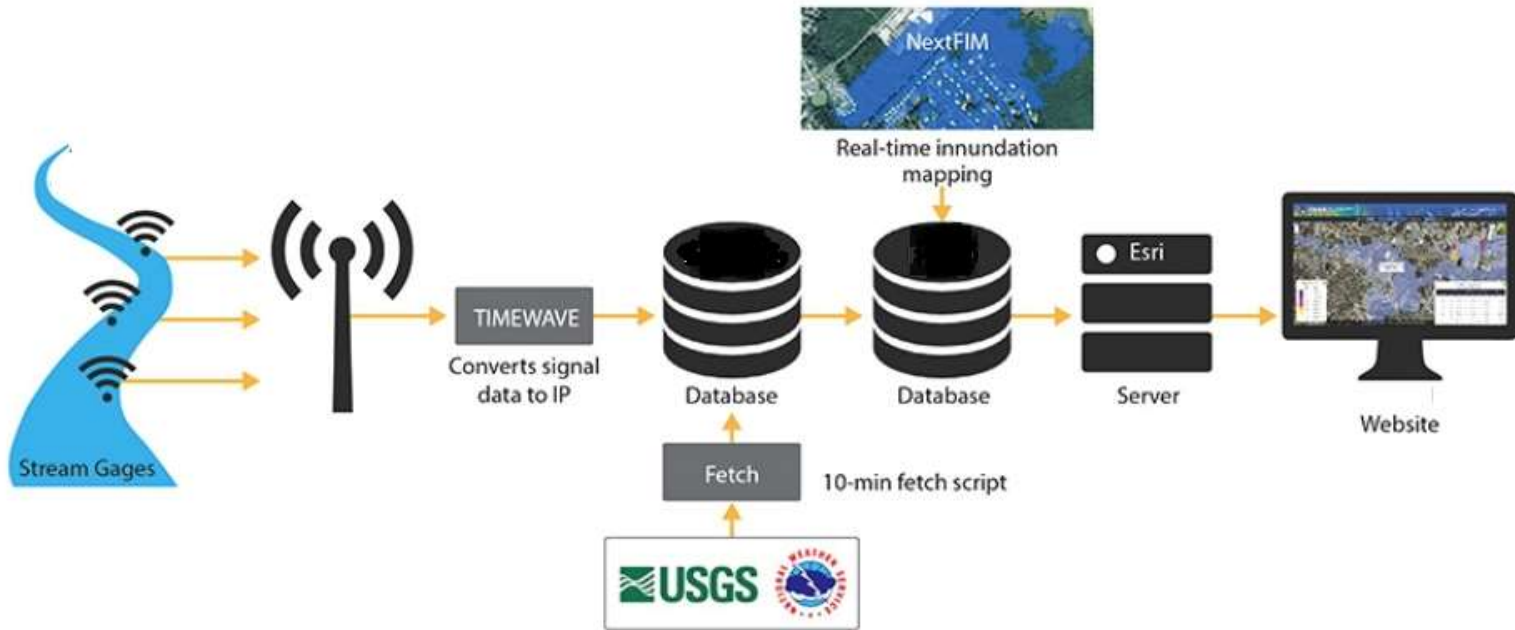

Evaluation of Existing Models

- Is the model geo-referenced?
- Is the scale appropriate?
- What datasets were used?
- How much work does the model need?
- Does the model include inline structures?
- Is there a correlating RFC flood forecast point?
- Model categorizing
 - Checklist
 - Metadata

I have a model, now what?

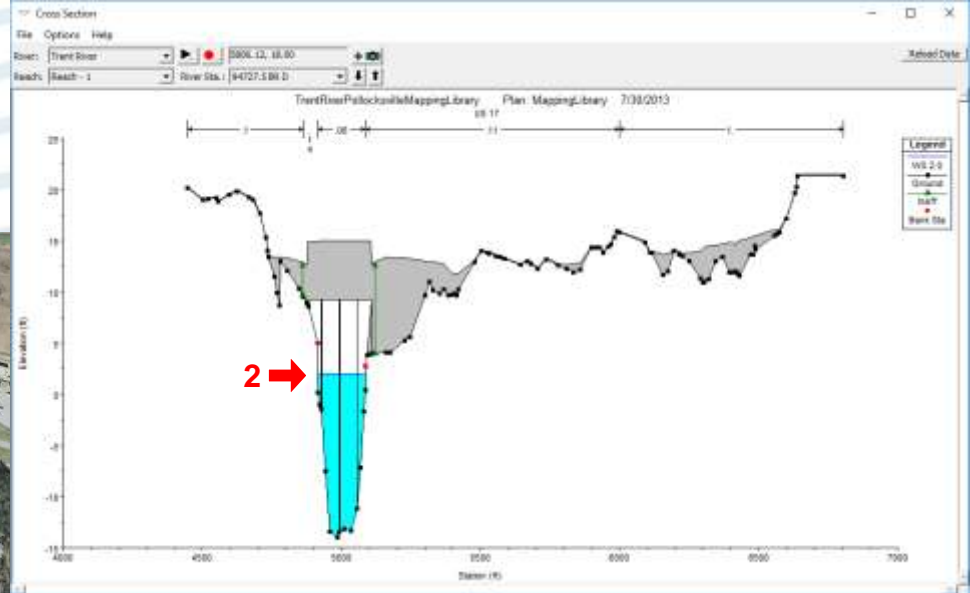

- Model update and calibration
- Generate flood map libraries
- Get those products out to the stakeholders

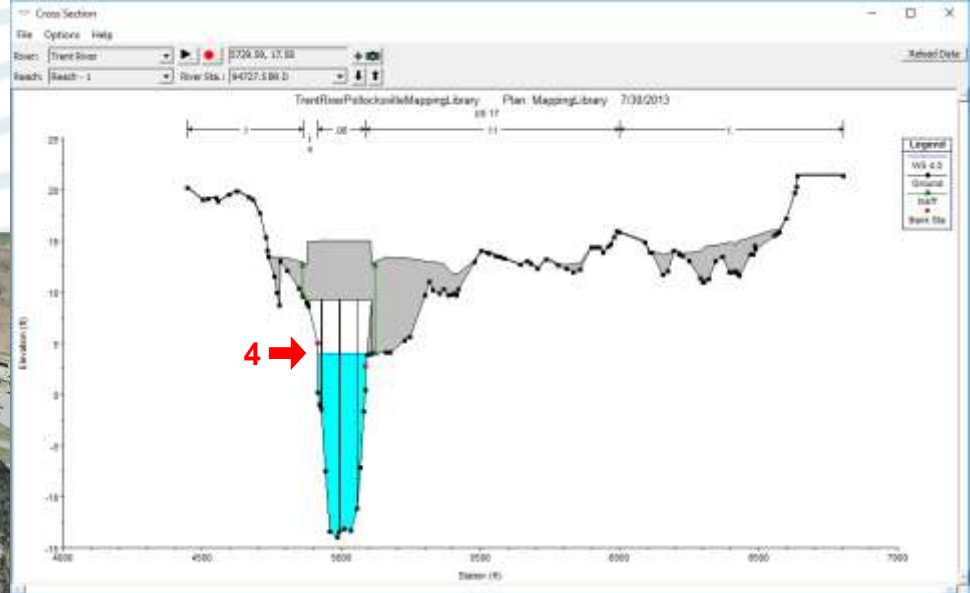

InFRM Web Application

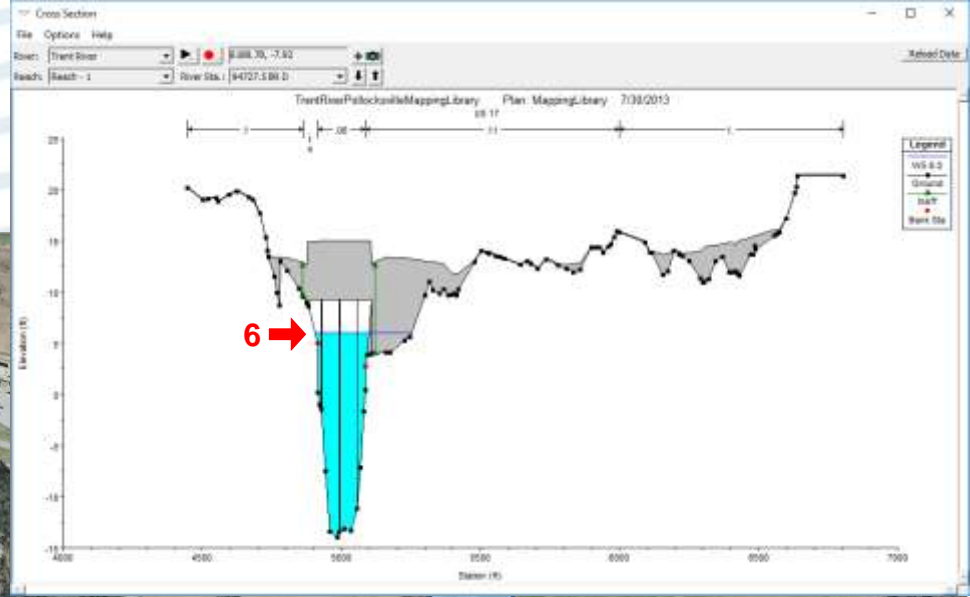

Library Creation

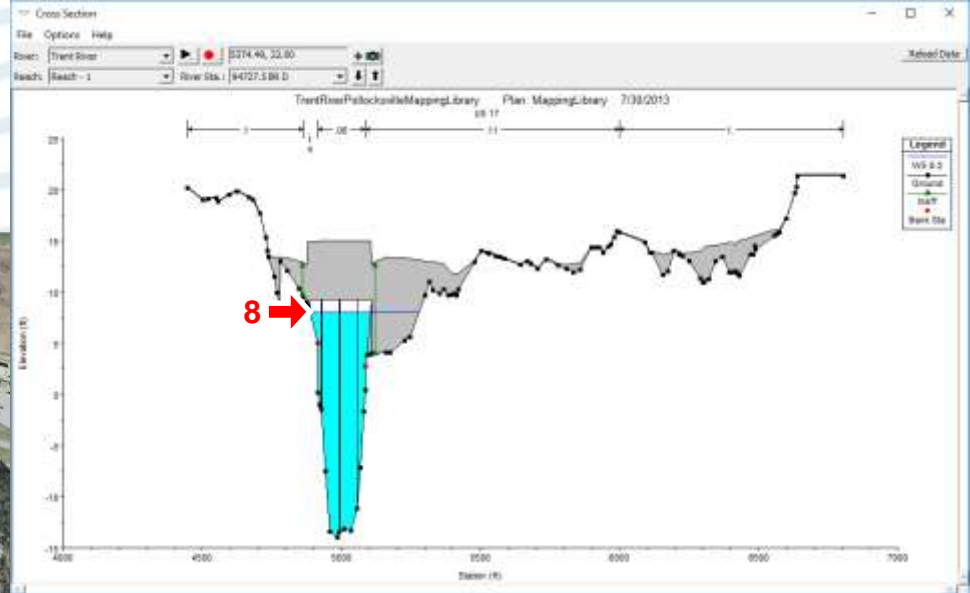

Library Creation

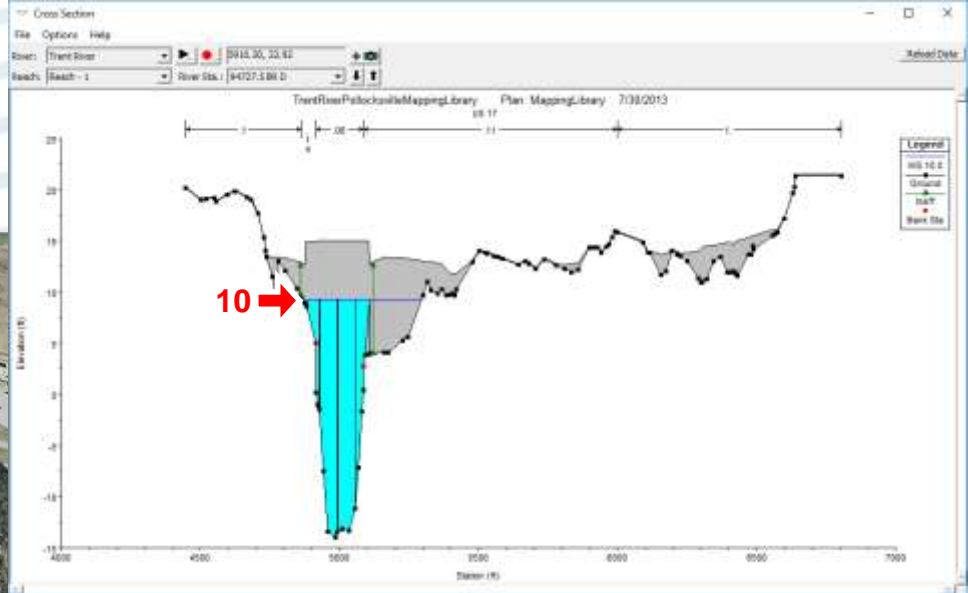

Library Creation

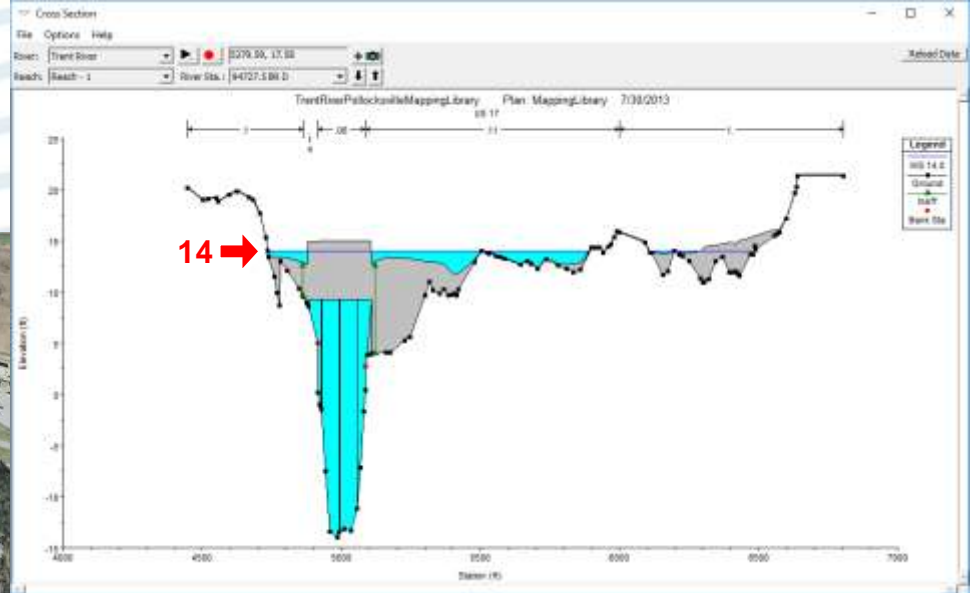

Library Creation

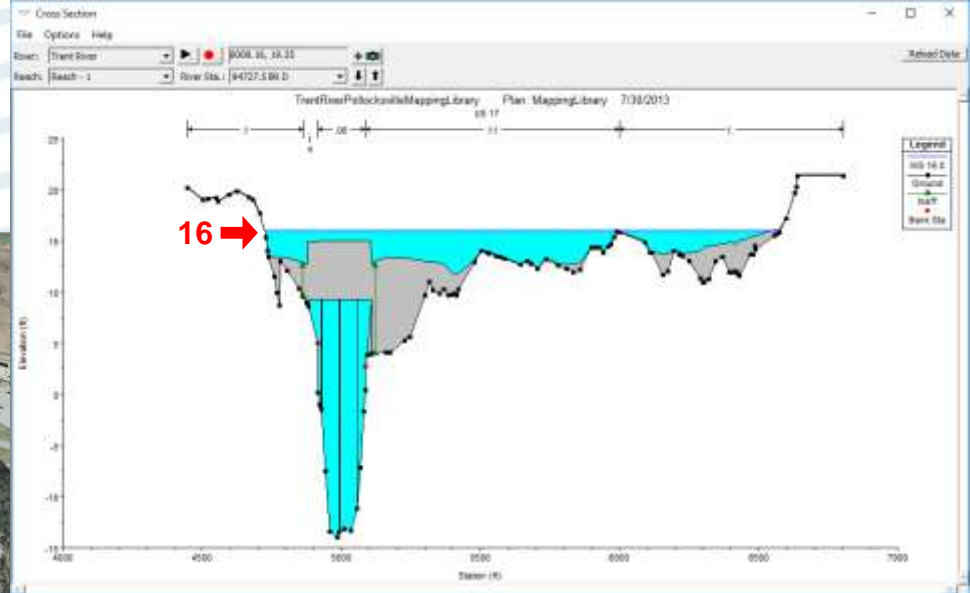

Library Creation

Library Creation

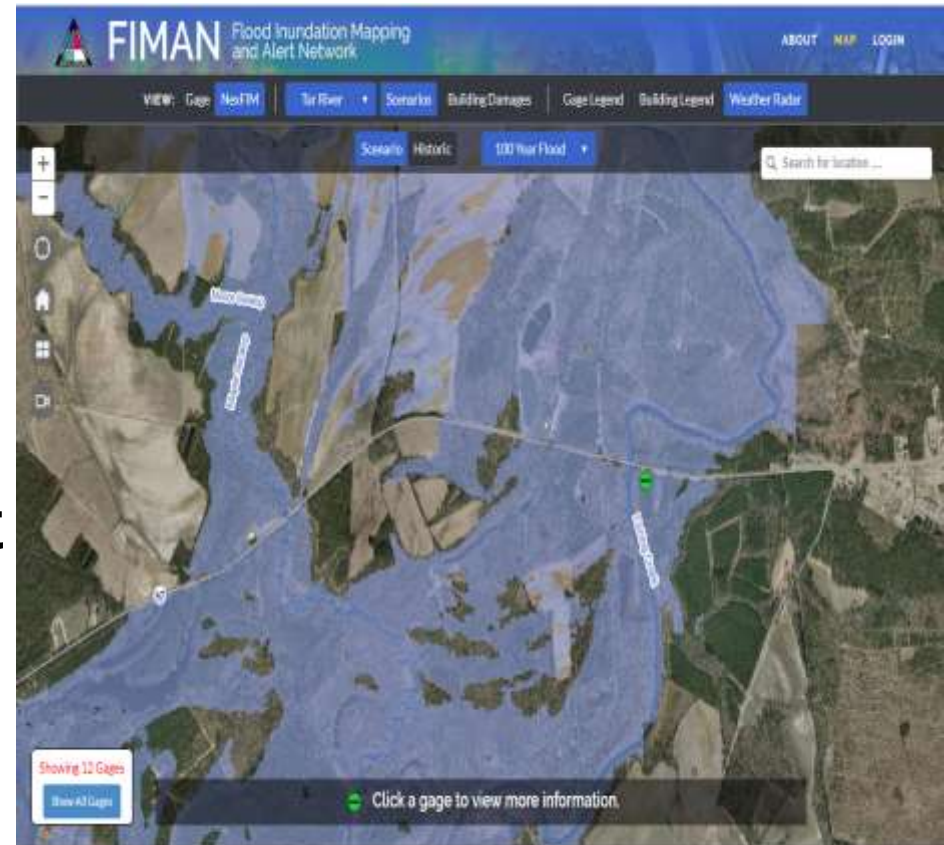

Library Creation

Library Pros

1. Inexpensive to develop
2. Accurate with measured stages and elevations
3. Easily communicated to stakeholders
4. Rapid web mapping deployment
5. Impacts can be pre-computed
6. North Carolina has worked through many of the issues with FIMAN

Uncertainty in Modeling

- **“All models are wrong but some are useful”**
 - You get out what you put in
- **The goal of calibration**
 - Get the “right” answer – Yikes!
 - Focus on bracketing the “right” answer
- **Best available data**
 - LiDAR vs. 10m DEM
 - DEM vs. surveyed cross sections
 - Engineering scale model vs. R&R
- **Understanding your flood inundation product**
 - Which product is available to you
 - Knowing which product is right for you

InFRM Flood Inundation Products

- **Web viewer for flood inundation maps**
 - Will provide quick easy access for stakeholders
 - Real-time updates with RFC forecasts
 - Scenario planning tool for emergency management
- **Produce flood inundation map libraries**
 - Leverage off of existing models
 - Use best available product
 - Minor flood stage to max expected flood
- **Model database**
 - Collect, compile, and evaluate
 - When needed, update and calibrate
 - Make available to the public
- **Build new models**
 - When appropriate

Advantages

- **Multi-agency approach**
 - Advanced scientific team
 - Leverage knowledge within each agency
 - Leverage existing flood inundation models
 - Represents multiple federal agencies working to support FEMA and their flood risk program
- **Cooperation between federal, state, and city government**
- **Leverages funding from multiple programs**
- **Results readily available to stakeholders**
- **Brings more federal tax dollars back to Texas for flooding**
- **Improved life safety**
- **Decreased property damages**

Stakeholder Driven

Just a sampling...I could not fit them all

Kristine Blickenstaff, PE

Associate Director (A)–North TX

Studies Chief – North TX
